

PYTHON FUNCTIONS

What Are Functions?

A function is a block of code which only runs when is called.

In Python a function is defined using the `def` keyword

```
def my_function():  
    print("Hello")
```

Arguments in a Function

Arguments are specified after the function name, inside the parentheses.

You can add as many arguments as you want, separate them with a comma.

```
def my_function(fname):  
    print(fname + "Refsnes")
```

```
my_function("Emil")
```

```
my_function("Tobias")
```

```
my_function("Linus")
```

Arbitrary Arguments

If you do not know how many arguments that will be passed into your function, add a before the parameter name in the function definition.

```
def my_function(*kids):  
    print("The youngest child is " + kids[2])  
my_function("sou1", "god1", "txspark")
```

Keyword Arguments (kwargs)

You can also send arguments with the key = Value Syntax.

```
def my_function(child3, child2, child1):  
    print("The youngest child is " + child3)  
my_function(child1="mcb", child2="bca", child3="btc")
```

Arbitrary Keyword Arguments, **kwargs

If you do not know how many keyword arguments that will be passed into your function, add two asterisk: ** before the parameter name in the function definition.

```
def my_function(**kid):  
    print("His last name is " + kid["lname"])  
my_function(fname="Tobias", lname="Refsnes")
```
